Healthy Weight Surveillance

Overweight and obesity contribute to chronic disease and disability, including diabetes, heart disease and cancer. Children who are overweight or obese are much more likely to be overweight or obese as adults. Healthy habits, including eating a diet rich in fresh fruits and vegetables and engaging in a variety of exercise, learned young can last a lifetime.

The goal of the Chula Vista Elementary School District's Healthy Weight Surveillance Project is to assess the weight status for students based on Body Mass Index (BMI). In order to calculate BMI, data on height, weight, and age were collected by trained staff. Once this data was collected, BMI was then be calculated. A total of 24,334 students were included in the Chula Vista Elementary School District (data from children with physiologic developmental delays were reviewed and excluded from analysis). Further analyses showed that from 2010 to 2018, the Chula Vista Elementary School District experienced no change (0.0%) in the underweight category, a 2.9% increase in the normal category, a 0.6% increase in the overweight category, and a 7.7% decrease in the obese category.

In order to continue to promote healthy weights among students, the Chula Vista Elementary School District has implemented several programs to continually combat the growing obesity epidemic. These programs include:

- Thriving District Wellness Committee consisting of parents, teachers, administrators, and community partners.
- The implementation of a Site Wellness Leads program which focuses on exploring available resources and needs of each individual school site.
- Physical Education, Health, and Wellness Coordinator and Physical Education Resource Teacher which provide support for schools.
- Exercise the Dream program at the Chula Vista Elite Athlete Training Center- this program allows students to attend a field trip to a training center where Olympic athletes and Olympic hopefuls train.
- Morning announcements that incorporate nutrition education.
- Water safety lessons for 4th graders.
- Physical education professional development opportunities for teachers.

With the continuation of these programs, the Chula Vista Elementary School District strives to continually see an increase healthy weights which will lead to healthy lives for all students.

Chula Vista Elementary School District, 2018: All Schools

Weight Category for All Students from 2010 to 2018

Statistical findings:

From 2010 to 2018, the Chula Vista Elementary School District saw a 7.7% decrease in the obese category.

From 2010 to 2018, the Chula Vista Elementary School District saw a 0.6% increase in the overweight category.

- The mean BMI of male students was higher than female students ($p < .001$).
- The mean BMI of Hispanic or Latino students was higher than the White students and Asian students ($p < .001$).
- The mean BMI of Black or African American students was higher than the Asian students ($p < .001$).
- The mean BMI of Native Hawaiian or Other Pacific Islander students was higher than the Asian students ($p < .001$).

Appendix C: Calculations and Notes

Methodology

Children were classified according to BMI percentile for age and gender in accordance with the CDC standardized groups as follows: (1) underweight (BMI at or below the 5th percentile) (2) normal weight (BMI between the 5th and 85th percentile), (3) overweight (BMI between 85th and 95th percentile), and (4) obese (BMI at or above the 95th percentile). BMI categories are mutually exclusive.

- Percent change =
$$\frac{(\text{New value} - \text{Old value})}{\text{Old value}}$$

- BMI =
$$\frac{\text{Students weight (kg)}}{(\text{Students height (m)})^2}$$

- Transitional kindergarten (KT) students were included in the trended data from 2010-2018 in order to maintain continuity in comparing trends throughout the years but were removed from each school's individual analysis by gender, grade level, and race/ethnicity for the year 2018.
- 2018 data does not include Preschools or Special Education Schools.
- Weight for 4th and 5th graders at Olympic View Elementary School was recorded as kilograms (kg) but reported as pounds (lbs.), therefore, their weights were converted from kg to lbs. and BMI was calculated from those new values. Outliers over 200lbs (obese) were removed from the sample (10 students total).
